PASS SUMMIT 2020

Everything is bigger in Texas.

Join us in Houston November 10 – 13, 2020
For the largest gathering of Microsoft
Data Professionals.

Make Plans for PASS Summit 2020

Over 200 sessions by industry experts and 3 days of networking with people just like you. Don't miss out, future-proof your career at **PASSsummit.com**

Your Presenter

John Q. Martin CITP

Data Platform MVP

Over a decade of experience working with the Microsoft Data Platform on-premises and in the cloud. Currently working in the financial sector and doing all things database engineering.

Professional

What is Infrastructure as Code?

A declarative representation of our infrastructure components that allows for automation deployment and management.

Why Infrastructure as Code

Removing humans from the process improves consistency of application.

Consistency of deployments

Automation

Infrastructure as Code

Infrastructure as Code

What is Terraform?

Command line tool that helps build infrastructure based on declared state.

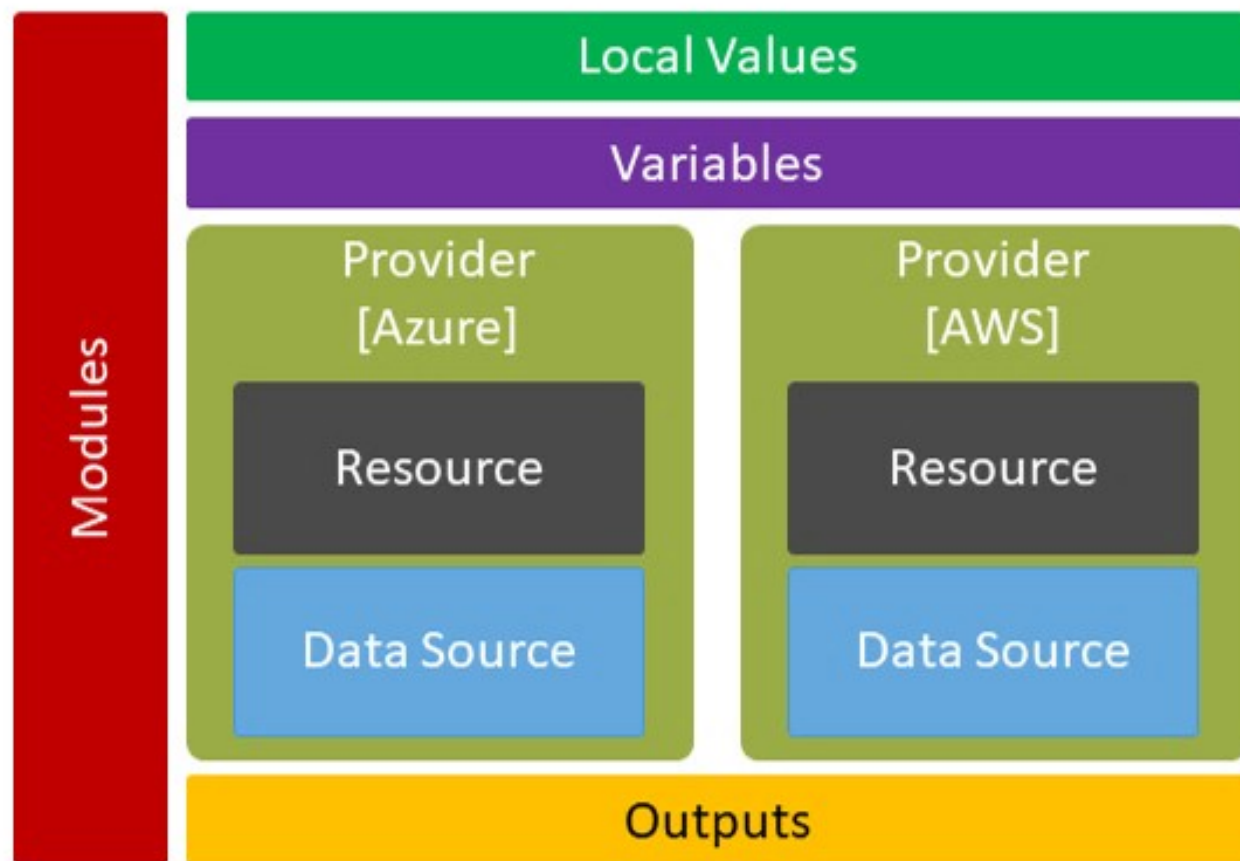

Uses HashiCorp Configuration Language (HCL) to define resources

Uses graphing concepts to identify relationships between resources prior to build

Basic Terraform Concepts

Building blocks allowing us to build infrastructure quickly and easily.

Reusable modules that abstract complexity from end users.

Providers

The interface to creating resources on different clouds and technologies

Handle connectivity and authentication for the target platform

Multiple providers can be used in a single Terraform solution

Azure
AWS
Azure Stack
Google Cloud
Docker
Kubernetes
VMware NSX-T
CloudStack
OpenStack
VMware vSphere
GitHub

Resources

These are what we want to create

Create implicit and explicit dependencies
between resources

Will be created in parallel as much as possible

Definition is specific to providers

State Management

Understand what the deployed environment looks like

Used for plans when you make changes

State can be managed locally or in a remote store.

Stored in JSON format.

Do not alter state files manually

Backend Management

Ability to store Terraform State in central locations.

- Terraform Enterprise
- Azure Blob Storage
- Amazon S3

Provides better management for team based management and automation.

- Locking state prevents multiple concurrent deployments

Demo

Quick look at Terraform in action.

Questions

Thanks for your time.
